FAA Cold Temperature Restricted Airports
Altitude Correction Plots
Sea Level Approximation

PART 2

Revision Date: May 28, 2017

Stefano M Rapisarda

Flight Deck Engineering

1.1 Abstract

Most aviation authorities' procedures and regulations require or recommend that pilots apply corrections to minimum instrument approach altitudes during periods of very cold weather conditions, or cold weather conditions in combination with terrain. The purpose of this document is to provide means to implement the cold temperature altitude corrections recommended by International Civil Aviation Organization (ICAO) in document PANS OPS Doc 8168 [1].

ICAO document PANS OPS Doc 8168 [1] recommends the use of three different formulas. These formulas provide altitude corrections with different degrees of approximation for an Off-ISA Atmosphere, which is an atmosphere with the same characteristic of the International Standard Atmosphere but whose temperature profile differs from ISA by a constant temperature offset.

The first formula, called "Sea Level Approximation" is the same used to calculate the well-known ICAO Cold Temperature Altitude Correction Table. It is the least accurate of the three formulas, as it assumes that the airport/station is located at sea level.

The second formula, called "Off-Standard Atmosphere Approximated" still includes approximations, yet it is more accurate than the first one, as it takes into account the airport/station elevation.

The third formula, called "Off-Standard Atmosphere" includes only minor approximations, providing the most accurate corrections.

This document provides Cold Temperature Altitude Correction Plots for airports identified by the FAA as "Cold Temperature Restricted Airports" [2], the list used is based on is the FAA Notice to Airman publication of April 27, 2017.

The formula used is the first of those recommended by International Civil Aviation Organization (ICAO) in document PANS OPS Doc 8168 [1], the so called "sea level approximation".

1.2 Disclaimer

These notes were produced to improve understanding of cold temperature correction and promote situational awareness. The content of this document should not be used for navigation and the user should always refer to current published approved documents and charts.

The pilot in command of an aircraft is ultimately responsible for its operation and safety during flight.

In these notes, the term "corrected altitude" is used with the intended meaning of "altitude corrected for non-standard temperature".
